

Management Report

Domain Analysis

Group: Yanis Niaussat, Sébastien Pinta, Marius Poirier, Rayan Tournay

Reporter : Sébastien Pinta

The objective of this phase was to model the business domain using a UML class diagram. The work focused on 10 use cases defined during the previous phase.

The work was divided among the team members, with each member responsible for modeling the use cases assigned to them.

We held a single synchronization meeting lasting approximately 3 hours and 30 minutes. During this session, we achieved a modeling completion rate of approximately 90%. The rest of the work was finalized by the merge manager.

The final result of this phase is the creation of a PlantUML model comprising 44 different classes and enumerations (Enums), all integrated into a coherent class diagram.

To ensure quality and rapid merging, the following conventions were adopted and strictly adhered to:

Nomenclature: Use of camelCase for all attributes.

Modeling tool: PlantUML.

The main difficulty arose in the middle of the work meeting: we realized that the role inheritance system had been poorly designed in the initial approach. The initial idea was to have roles inherit directly from the User class.

Proposed Solution: We refactored the model to introduce an association/aggregation relationship between the User class and an abstract Role class. This much more flexible approach allows a User to have multiple roles (Player, Coach, Organizer) simultaneously.

We also realized that putting the accessors in the UML was not very useful and made the diagram harder to read, so we didn't put them.

What I learned was modeling the entire domain together and ensuring strict nomenclature from the outset was crucial. Detecting and correcting the role system issue during the group meeting saved valuable time and prevented a major inconsistency in the model that would have been more difficult to correct later on.

Personally, I found that we were well organized and communicated well, which meant that the work went smoothly. We were even able to consult with you to improve the diagram.
