

Unit Test Report - RYMS

As the lead for unit testing, I ensured the quality of our use cases by supervising the creation of test classes. We spent approximately 5% of our total time on testing. A major challenge was testing features linked to the database, because the database changed a little bit during the development process, and some tests that worked before stopped working the next split, the solution was not really related to unit testing, we had to change an SQL query. I learned that unit testing can be useful to verify that the features work without manually testing them. The only thing I have to say is that we still have to run the tests manually, so in the future, I would use CI/CD automation to replace manual verification and save time.
